

Integer to String Conversion

To convert an integer value to a string it is necessary to include both the `sstream` and `string` header files. Create a variable of type `ostringstream` and use the stream operator to send the value of the integer variable. The `ostringstream` variable has a member function called `str()` which can be used to return the value of the `ostringstream` in string format. This method also works for floats and doubles.

Source Code

```
#include <sstream>
#include <string>

using namespace std;

string integerToString(int value) {
    ostringstream o;
    o << value;
    return o.str();
}
```
